DIRT WORKER

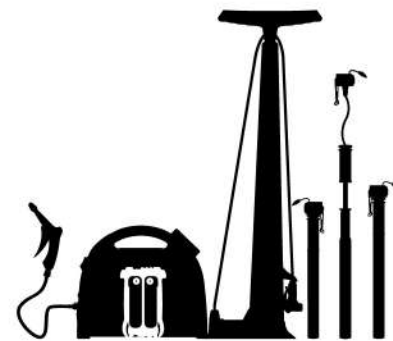

You're back at your car with a filthy bike. At this point you have a couple of options. Either you put the bike in the car, thus risking possibly terminal soiling of the upholstery, headlining or both. Or you put it on a rack on the outside of the car, which inevitably means that by the time you get home the wind will have dried the dirt on the bike into an almost impenetrable crust. Either way you arrive home with a manky bike, which is likely to be a nuisance, particularly if your domestic circumstances require you to keep your bike in your front room.

What's needed here is some way to clean your bike before it goes back in or on the car. You could take a bucket and brushes, but you'd need some water too. We know people who carry one of those hand-pumped garden sprayers in their cars, but they're not all that good at shifting dirt. There's always the trusty power washer, but they have a couple of drawbacks for use in the field—they need mains electricity and they have a prodigious appetite for water. And of course the power washer's ability to strip grease from bearings is well documented.

The Washing Machine, then, could be exactly what you've been waiting for. It's a portable 12V power washer with an integral 13l (3.5 gallon) water tank. Fill the tank at home, put it in the boot and when you're done riding, plug it into your car's "accessory socket" instant bike cleaning action.
